

TallyBook

Autonomous AI Finance Controller & Bank Reconciliation

Enterprise-grade multi-pass autonomous settlement, continuous cash positioning, and SOX-compliant audit ledger — rules-first, AI only where rules structurally cannot resolve a match.

Run the books. Trust the exceptions.

Reconciliation is still the #2 named SME pain point

Empirical ranking across 2,400+ accounting automation product demos (IBS Intelligence, 2026)

EMPIRICAL PAIN POINT RANKING

#1 Accounts Payable / Bill Processing

#2 Bank & Credit Card Reconciliation

#3 GST Return Reconciliation

TallyBook targets the #2 bottleneck directly — bank & credit card reconciliation.

37.3% of demo attendees were founders/owners themselves — converting at 10.7%, the highest of any buyer category.

WHY NOW

Verification is the bottleneck

AI can already generate answers — the 2026 consensus is that checking whether they're right is the unsolved problem.

Continuous, not month-end

The market is shifting from manual month-end crunches to AI-assisted, continuous real-time ledger auditing.

MSMEs are already digital

70%+ prefer smartphones, 43% use UPI, 97% use WhatsApp Business. 68% report growth post-digitalization — the receptivity exists.

A multi-tier decision matrix — not a black box

Every statement line cascades through deterministic tiers before AI ever touches it — unmatched records fall through to the next tier, then branch by confidence.

Real engineering problems, deliberately solved

From the AI usage & development log — the hurdles hit while building TallyBook, and how each was closed.

Cherry-picked match bias

Hackathon demos often assert unsubstantiated 100% accuracy on hand-picked data.

SOLVED

Built a 101-record synthetic ground-truth batch — fee creeps, date offsets, split disbursements, and a genuine unresolvable tail.

The “decorative AI” trap

Risk of applying LLMs to standard math that deterministic code already handles better.

SOLVED

Rules-first architecture: exact/tolerance matches stay deterministic — AI is invoked only for vendor normalization and justification synthesis.

Proving model accuracy

Claimed accuracy numbers in demos are routinely distrusted by evaluators.

SOLVED

Live Ground-Truth Calibration view: claimed confidence plotted directly against verified accuracy, with false-match tracking.

Security in the data layer

Automated scans surfaced SQL injection and XSS vectors in early user-input handling.

SOLVED

Converted to parameterized queries + output sanitization — re-scanned by HackerGPT, zero critical/high vulnerabilities.

Proof over hype, backed by a tamper-evident ledger

SOX 404 CRYPTOGRAPHIC AUDIT CHAIN

$H_i = \text{SHA256}(H_{i-1} \parallel \text{Timestamp} \parallel \text{ActorRole} \parallel \text{Action} \parallel \text{EntityId} \parallel \text{StateDelta})$ — dual-key sign-off required above \$10,000.

PRODUCT DEPTH

A \$15.52B market, and the MSME tier is wide open

Global reconciliation software market · 18.6% CAGR · bank/cash reconciliation holds 44.3% functional share in 2026

THE INDIAN MSME OPPORTUNITY

63.4M+

MSMEs contributing ~30% of India's GDP

29%

of tech-savvy MSMEs use any accounting software

97% / 43%

use WhatsApp Business / UPI — infrastructure is ready

68%

report growth post-digitalization

COMPETITIVE WHITE SPACE

Enterprise incumbents

Oracle, SAP, Trintech — six-figure deployments, priced for Fortune 500 balance sheets

Manual tier

Spreadsheets, paper ledgers, basic Tally/Busy — zero automation

TallyBook's sweet spot

Autonomous, multi-pass precision at MSME-accessible pricing — the gap nobody else fills

A bottom-up flywheel — not top-down enterprise sales

ROADMAP

- Multi-currency, real-time FX support
- Direct commercial banking open-API webhooks
- Automated GSTN reconciliation
- Deeper CA/audit-firm multi-entity tooling

BUILT WITH

- FastAPI backend + React 19 / TypeScript / Tailwind v4
- Groq Llama 3.3 70B for runtime semantic reasoning
- JWT auth + role middleware (controller, analyst, auditor, admin)
- HackerGPT-audited — zero critical/high vulns post-fix
- Full AI tool usage log in AI_USAGE_AND_DEVELOPMENT_LOG.md
